

Computer Networks

SS 2004

Prof. Dr. Wolfgang Effelsberg

Lehrstuhl für Praktische Informatik IV
Universität Mannheim

Contents (1)

1. Introduction

- 1.1 Definition of a Computer Network
- 1.2 Standard Organizations
- 1.3 Protocol Architecture
- 1.4 ISO/OSI Reference Model

2. Physical Layer

- 2.1 Definition
- 2.2 Mechanical, Electrical and Functional Specifications
- 2.3 Transmission Techniques, Modulation, Multiplexing
- 2.4 Physical Media
- 2.5 Examples: V.24, ADSL

Contents (2)

3. Data Link Layer

3.1 Transmission Errors

3.2 Error Detecting and Error Correcting Codes

3.3 Bit Stuffing

3.4 Acknowledgments and Sequence Numbers

3.5 Flow Control

3.6 Examples: HDLC, PPP

Contents (3)

4. Local Area Networks

4.1 Topologies for Local Area Networks

4.2 Medium Access Control

4.3 ALOHA

4.4 CSMA/CD (Ethernet)

4.5 Hubs and LAN Switching

4.6 Token Ring

4.7 Wireless LAN (IEEE 802.11)

4.8 Logical Link Control for LANs

4.9 LAN Bridges

Contents (4)

5. Wide Area Networks and Routing

5.1 Packet Switching

5.2 Virtual Connections vs. Datagrams

5.3 Routing in Unicast Networks

5.4 Routing in Multicast Networks

5.5 Congestion Control

5.6 Examples: IP Version 4, IP Version 6, ATM

6. Transport Layer

6.1 Internet Transport Layer Architecture

6.2 UDP (User Datagram Protocol)

6.3 TCP (Transmission Control Protocol)

Contents (5)

7. Application Layer

7.1 Internet Application Layer Architecture

7.2 **SMTP** for Electronical Mail

7.3 **FTP** for File Transfer

7.4 **NFS** for Remote Access to Files

7.5 **TELNET** for Virtual Terminal (Remote Login)

7.6 **HTTP** for the World Wide Web

7.7 Telephone Services over IP

8. Directory Services: The Domain Name Service

8.1 DNS Naming

8.2 DNS Protocols

1.1 Definition of a Computer Network

Definition

A computer network connects independent computers for the purpose of data exchange.

As opposed to:

- Bus, channel
- Interconnection network for parallel computers (multiprocessor systems)
- Terminal network

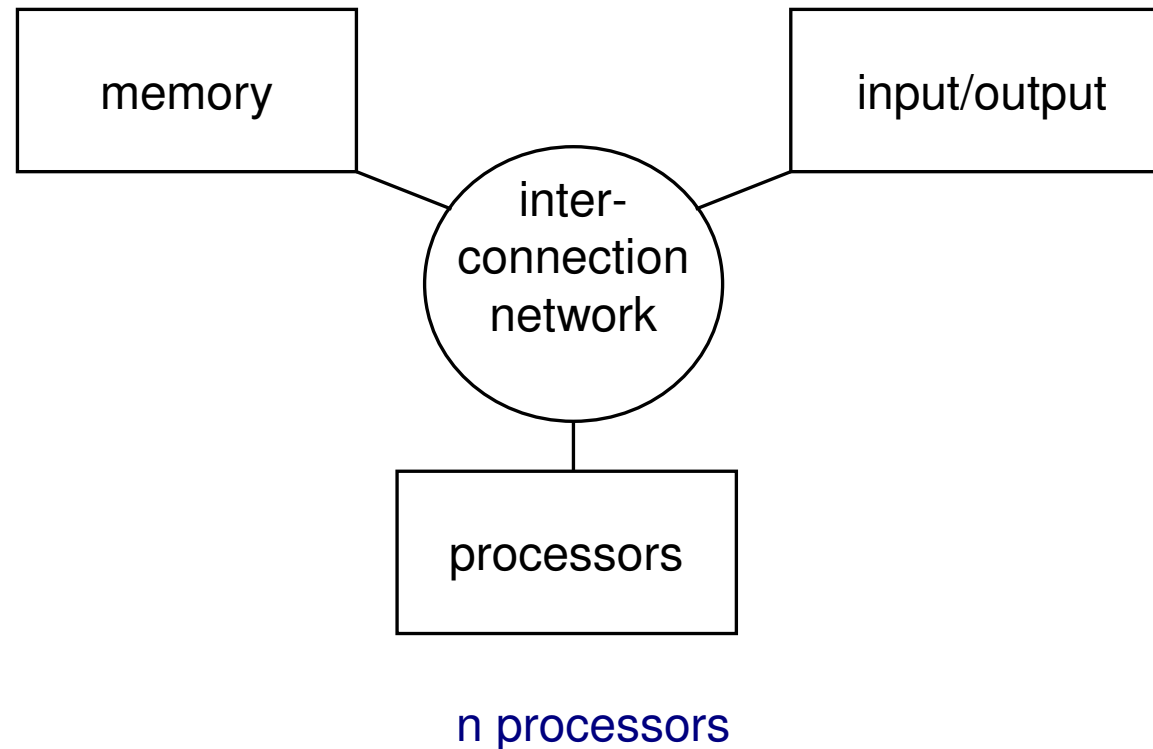

Bus

A **bus** connects the components of a computer within the box.

Interconnection Network

Interconnection network in a multiprocessor

Terminal Network

1.2 Standard Organizations

- International Organization for Standardization (ISO)
- International Telecommunications Union (ITU)
- CEN/ CENELEC/ ETSI (European)
- National Institute of Standards and Technology (NIST)
- and many more

International Standards Organization (ISO)

Standardization on an international level

- Members: National Standards Organization (DIN, ANSI, AFNOR,...)
 - ISO TC 97: Information Processing Systems
 - DIN: Normungsausschuss Informationsverarbeitung (NI)
 - TC 97/SC 6: Data Communications
 - TC 97/SC 18: Text and Office Communications
 - TC 97/SC 21: Open Systems Interconnection
- Steps towards a standard:
 1. Working Draft (WD)
 2. Draft Proposal (DP)
 3. Draft International Standard (DIS)
 4. International Standard (IS)

International Telecommunications Union (ITU)

Formerly: Comité Consultatif International de Télégraphie et Téléphonique (CCITT)

- ITU-R (ITU Radiocommunication Standardization Sector)
- ITU-T (ITU Telecommunication Standardization Sector)

- International union of telecom organizations
- Plenary assembly every 4 years (..., 1980, 1984, 1988, 1992, 1996 ...)
- Standard documents are called „recommendations“
- ITU is a UN organisation

CEN / CENELEC / ETSI

- European Standards Organizations
- Europe-wide harmonization of national standards
- Often prepare input for ISO and ITU-T

Internet Standards

- IAB (Internet Activity Board)
 - IETF (Internet Engineering Task Force)
 - IRTF (Internet Research Task Force)
- RFC (Request for Comment) fulfills the role of an internet standard. Surprisingly the definition of RFCs is an informal process!
- Working groups, each with a leader
 - anyone can become a working group member
 - communication mainly by e-mail, occasional IETF meetings
 - typical duration: 9-18 months
 - result: Internet Draft
- Steps towards a standard: Internet Draft → at least two independent implementations; interoperability tests; stability for 4 months → Internet Standard (RFC)

Industry Consortia

- Association of predominantly industrial partners
- Goal: rapid realization of compatible products. Therefore: quick development of a common de-facto standard
- Submission of the results to international standardization organizations
- Exaples:
 - NFS (Network File System)
 - ATM (ATM-Forum)
 - WWW consortium

1.3 Protocol Architecture

We structure the complex communication system into *layers*:

- The lowest layer (layer 1) provides the physical connection.
- Each higher layer adds more functionality, hiding details from the next higher layer.
- „Horizontal“ interfaces between layers are a local matter (there is no need for standardization). They are called „service interfaces“.
- The rules of communication between two entities at the same layer are called „communication protocol“.

1.4 The ISO/OSI Reference Model

- OSI = OPEN SYSTEMS INTERCONNECTION
- In short: ISO/OSI Reference Model
- ISO International Standard 7498
- Introduces the layered architecture and basic terminology
- Proposes seven layers and their functionality

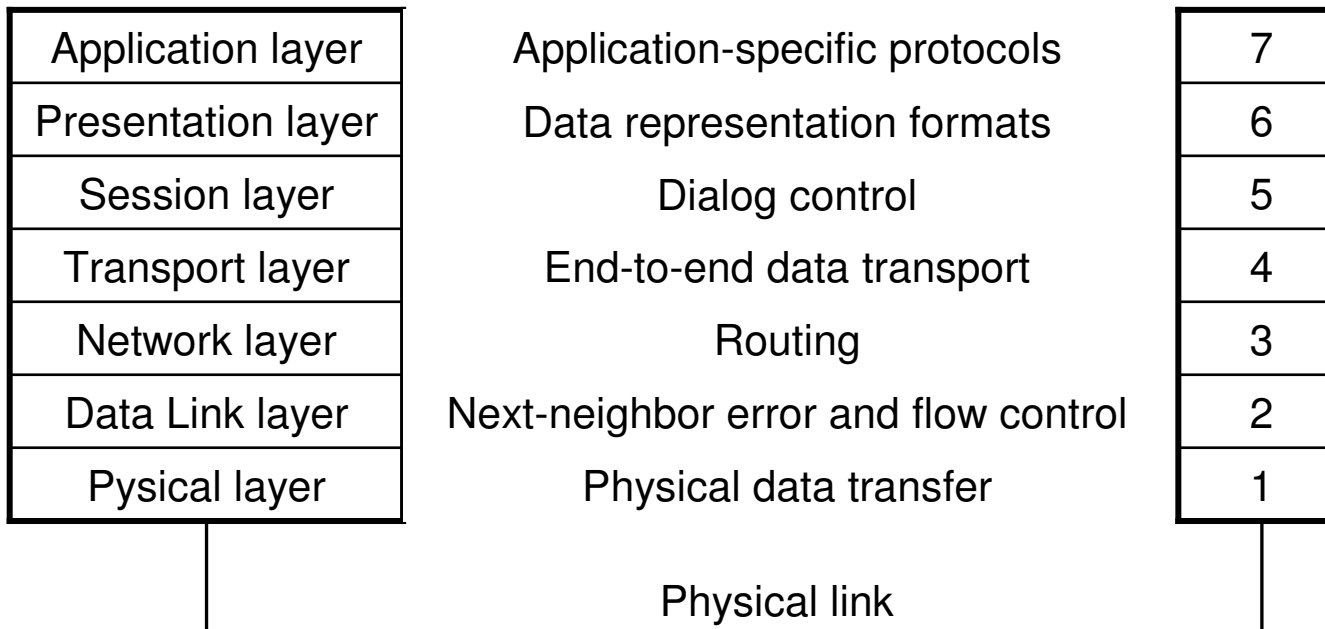

Seven Layers and their Functionality

Terminal A

Terminal B

Seven Layers of the ISO-Reference Model (1)

- The **physical layer** provides the transmission of a digital data stream over a transmission line.
- The **data link layer** provides error and flow control for the physical bit stream. In LANs it also implements medium access control.
- The **network layer** provides routing algorithms to compute end-to-end paths through the network. It also implements packet queueing and forwarding in the “routers”.
- The **transport layer** provides reliable end-to-end data connections from a process at the source node to a process at the destination node.
- The **session layer** coordinates the cooperation (dialog) between applications.

Seven Layers of the ISO-Reference Model (2)

- The **presentation layer** provides a common transfer syntax for all systems, and conversion rules from the local to the common data representation.
- The **application layer** implements the application-specific protocols.

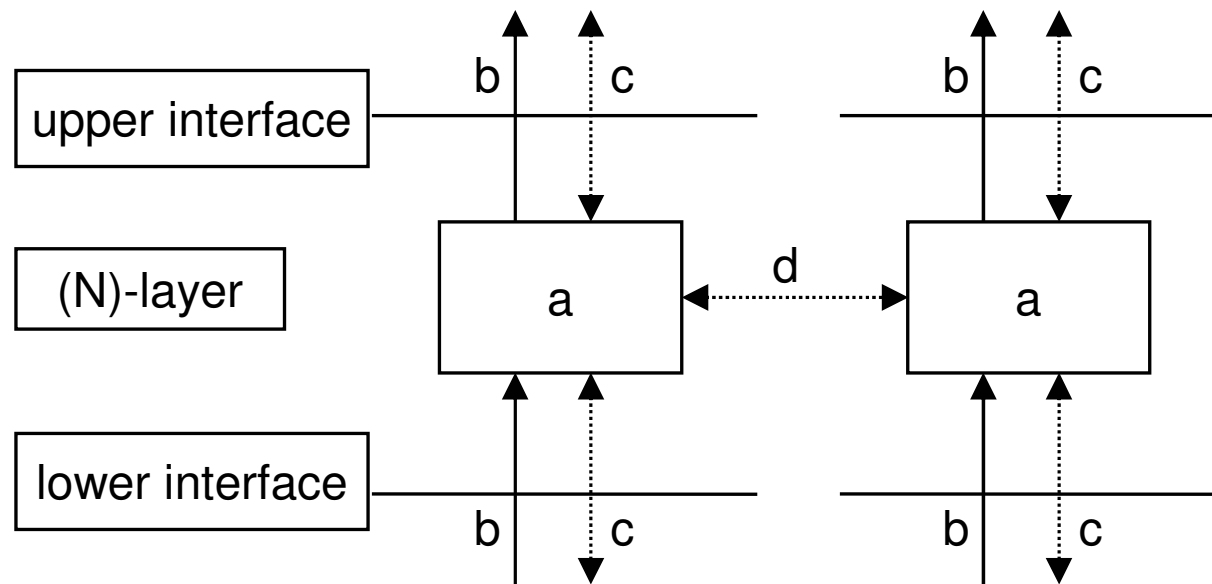

Terminology of the ISO Reference Model (1)

- **Open System**
 - Computer system (hardware, software, periphery, ...) that intends to communicate and implements the OSI standards
- **(N)-Layer**
 - Is formed by all entities of a (N)-hierarchy level in all open systems
- **(N)-Entity**
 - Implementation of a (N)-layer in a system
 - There can be different types of (N)-entities that implement (N)-layer protocols in a different way, e.g., from different manufacturers
- **Peer Entities**
 - Entities of the same layer at different locations.

Terminology of the ISO Reference Model (2)

- The main task of every layer is to offer **services** to the layer above. These services are made up of
 - services implemented within this layer, and
 - the cumulative result of services of all the layers below.
- Layers are connected to the next higher and lower layers by **service primitives**.
- Direct (local) communication takes place with layers (N+1) and (N-1).
- Indirect communication with peer entities takes place according to the rules of the communication **protocol**.

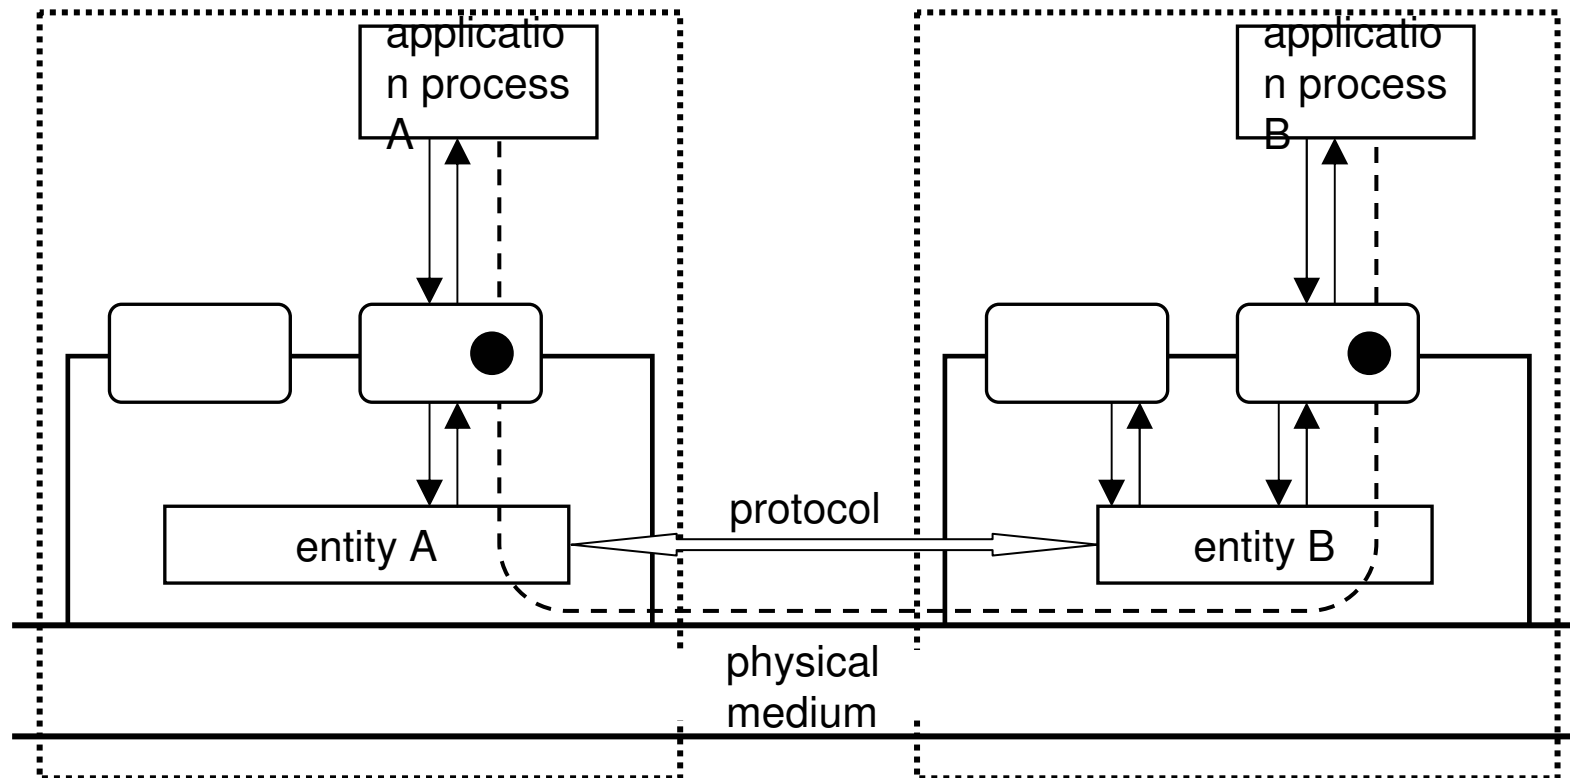

Terminology of the ISO Reference Model (3)

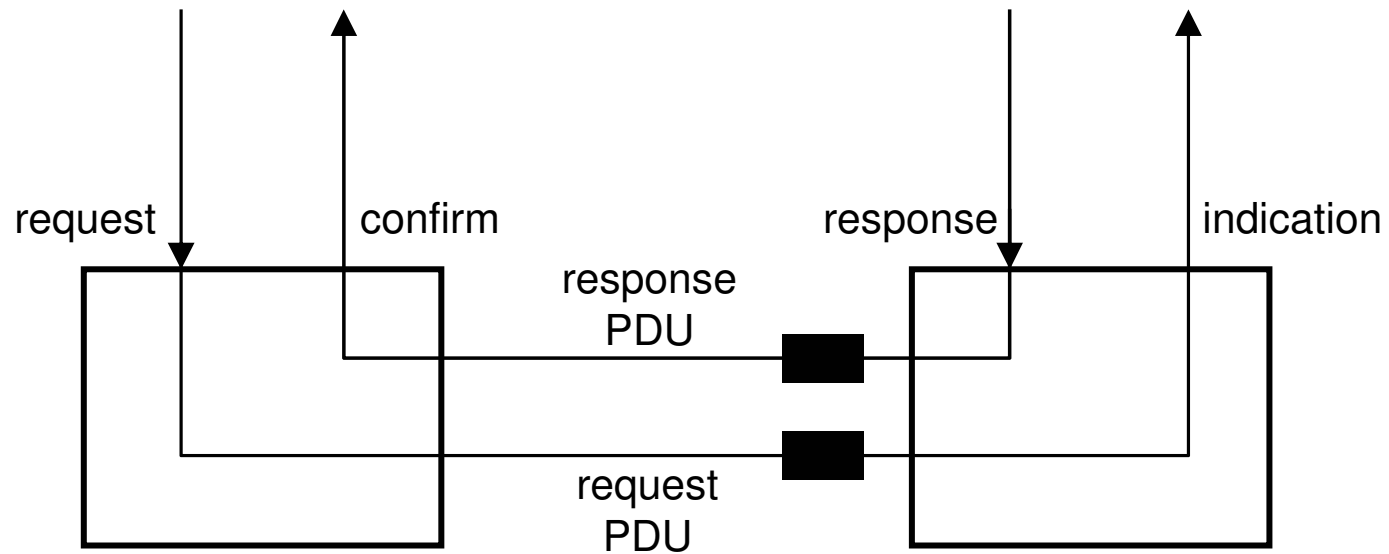

a = Peer Entities
b = Layer Service
c = Service Primitives
d = Protocol

Protocol

A **protocol** is the set of rules for data exchange between two entities of the same layer.

Service Events and Protocol Data Units

Types of Service Primitives

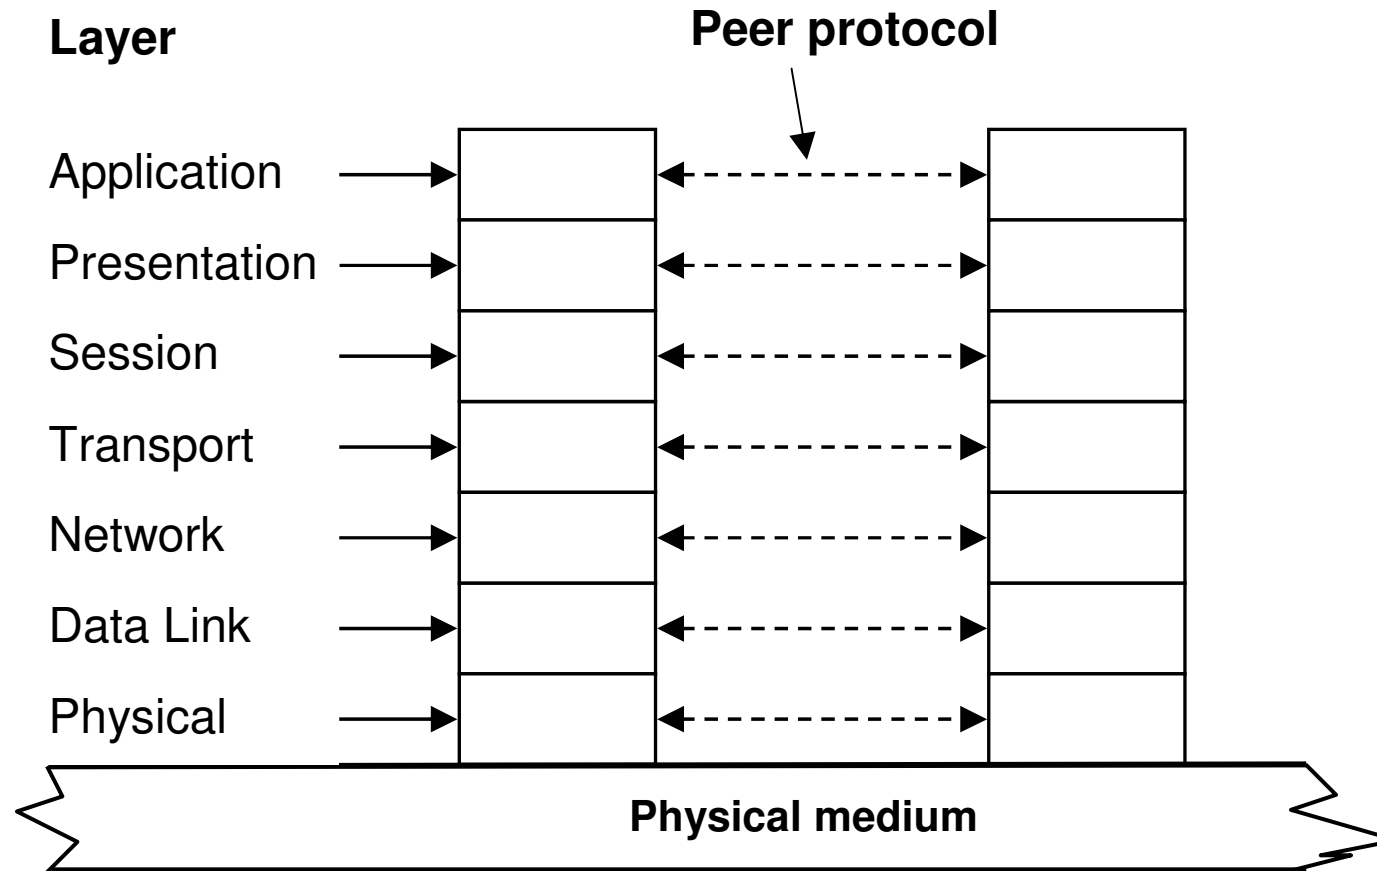

- Request
 - request of a service by the user
- Indication
 - indicates to the user that a service has been requested by the remote user or that an event has occurred in the layer
- Response
 - acknowledgement of a preceeded indication by the user
- Confirmation
 - acknowledgement of a preceeded request to the local requestor

Headers and Trailers in the Layered Model

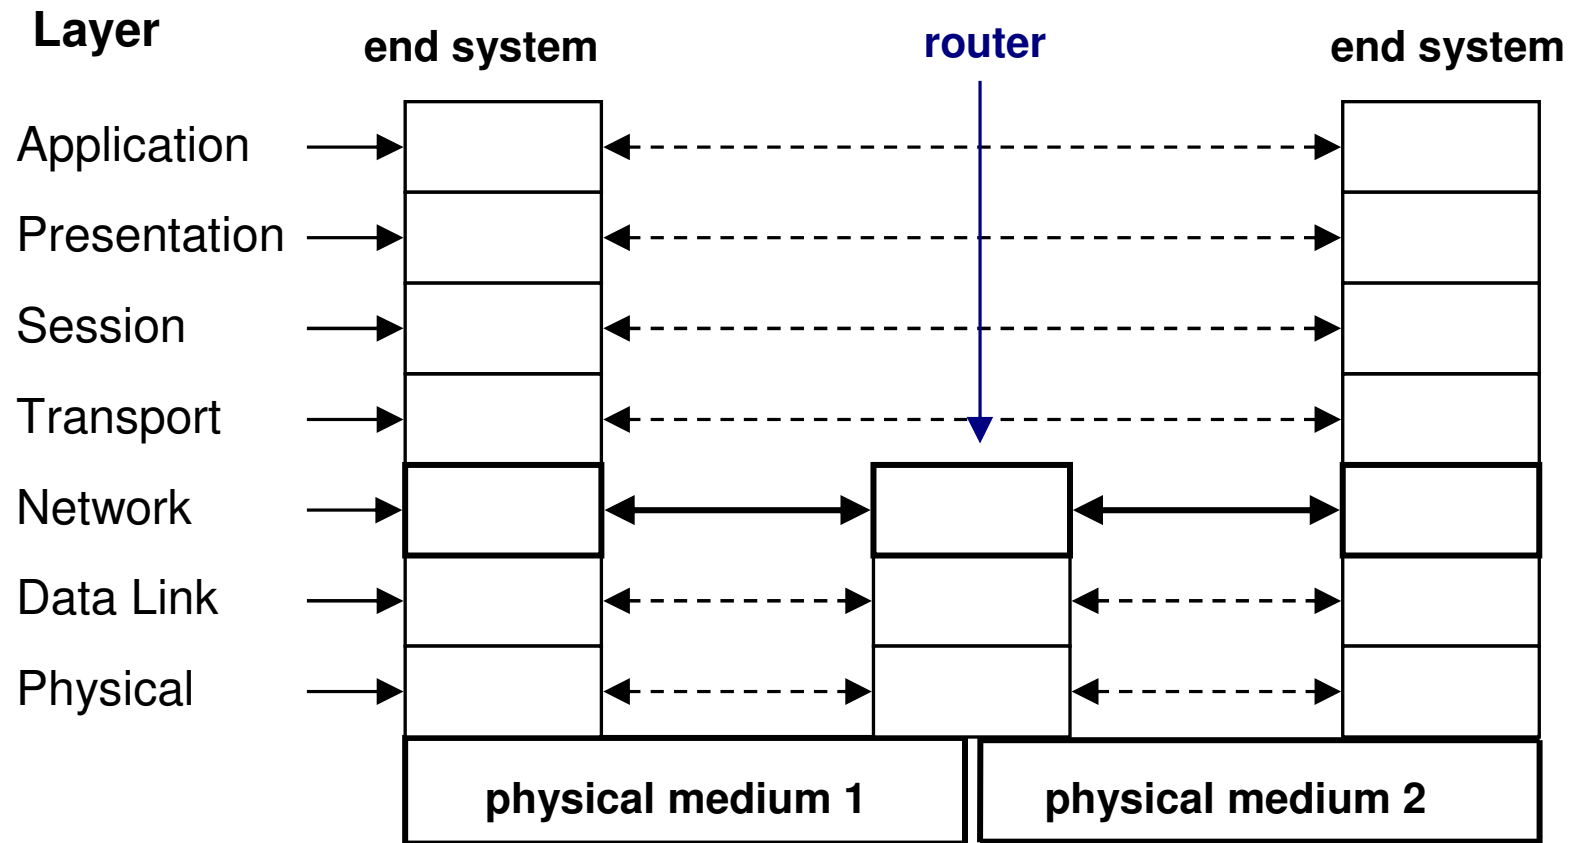

Application layer	Application protocol	← AH data →	Application layer
Presentation layer	Presentation protocol	← PH data →	Presentation layer
Session layer	Session protocol	← SH data ↔ ↔ →	Session layer
Transport layer	Transport protocol	← TH data →	Transport layer
Network layer	Network protocol	← NH data →	Network layer
Data Link layer		← DH data DT →	Data Link layer
Physical layer		← bits →	Physical layer

Reference Model and Peer Protocols

Router

Layer Models of Different Network Architectures

Layer	ISO	Internet	SNA
7	Application	smtp ftp telnet http ...	End user
6	Presentation		NAU services
5	Session		Data flow control
4	Transport	TCP, UDP	Transmission control
3	Network		Path control
		IP	
2	Data Link	Data link control	Data link control
1	Physical	Physical	Physical
